Forging Matters

World - Class Forging Systems for the Most Demanding Machines

Product Range

**Din Conical, Plate, Stainless Steel Flanges, Auto Parts, Crank Shaft,
Gears, Borwell components, Gear Flange Coupling and many more.**

Flanges:

Forged Products:

PM Technoforge Forging & Engineering is a fast growing forging company in India with focus on meeting today's challenges for Forged products. PM Technoforge (India) LLP, came into existence in the year 2018. We are currently reckoned in the market as one of the leading Manufacturers of machinery components and automotive materials.

Having in house installed capacity of 7500 TONS per annum with latest 2.5 Ton Belt Drop Hammer and 3.0 TON Pneumatic HUTA MPM Hammer. The products array includes Din Conical, Plate, Stainless Steel Flanges, Auto Parts, Crank Shaft, Gears, Borwell components, Gear Flange Coupling and many more. Our total and strict quality control measures right from the beginning of the production process till end has earned us the prestigious ISO-9001:2015 certification (certificate no. 85 100 001 19090) and PED certificate (certificate no. 01 202 IND/Q-19 0037).

DRIVEN BY POSSIBILITY™

YOU KNOW THE DRILL. SO DO WE.

//////
Gates innovative solutions can be found on virtually every part of a water well drilling rigs, and the equipment that supports operations. From top drives to mud pumps, and everything in-between, our team of industry experts and product engineers design, test, and manufacture Gates solutions that are trusted to power your most complex pumping and hydraulic equipment under the most demanding conditions.

G2XH XTREME™ HEAT HOSE

- Long life oil resistant tube
- 2 wire performing hose
- Abrasion resistant robust cover
- MSHA “2G” approved cover
- More flexible
- Pin pricked cover

Recommended for pressurized oil/air compressor delivery lines, specially designed for water well rig application.

Working Pressure: 1800 PSI (-24) & 1500 PSI (-32)

Temperature: -40°C to +149°C

DRIVEN BY POSSIBILITY™

G2XH XTREME™ HEAT HOSE

- Long life oil resistant tube
- 2 wire performing hose
- Abrasion resistant robust cover
- MSHA “2G” approved cover
- More flexible
- Pin pricked cover

Recommended for pressurized oil/air compressor delivery lines, specially designed for water well rig application.
Working Pressure: 1800 PSI (-24) & 1500 PSI (-32)
Temperature: -40 °C to +149 °C

MXT™ WIRE BRAID HOSE - SAE 100R16

More flexible with up to 40% lower force-to-bend for faster and more ergonomic installation.
Temperature Range: -40°C to +100°C

MEGASYS™ MXG™ 4K SAE 100R12

Lightweight, highly flexible, and qualified to ONE MILLION impulse cycles.
Temperature Range: -40°C to +121°C

MINE MASTER™ AIR DRILL HOSE

Recommended for Heavy duty, high pressure use on Industrial construction & pneumatic mining applications.
Temperature Range: -32°C to +82°C

AIR-WATER HOSE

For all air and water applications requiring maximum flexibility in engineering industry, workshops, shipyards, irrigation etc.
Temperature Range: -30°C to +82°C

FLEXMORE HOSE

For High pressure Hydraulic lines
Working pressure: 3600 PSI
Temperature Range: -40°C to +100°C

G1 1-WIRE BRAID HOSE - SAE 100R1

For Medium pressure hydraulic lines, Meets performance requirements of EN 853 1SN.
Temperature Range: -40°C to +100°C

G1 H HIGH TEMP 1- WIRE BRAID HOSE

For Medium pressure hydraulic oil lines, Meets or exceeds the performance requirements of SAE 100R1 Type AT
Temperature Range: -40°C to +135°C

4XH SPIRAL WIRE HOSE

For High pressure and high impulse applications. Most flexible EN 856 4SH hose in the industry.
Temperature Range: -40°C to +100°C

4XP SPIRAL WIRE HOSE

For Extremely high-pressure and high impulse hydraulic applications. Most flexible EN 856 4 SP hose in the industry.
Temperature Range: -40°C to +100°C

150 years of shaping the future

WHAT'S IT LIKE TURNING 150?

It feels just like the beginning. The way it felt making our very first compressor, industrial tool, vacuum pump and power generator. The way it feels knowing that our products, solutions, and services enable everything from safe medical treatment to the production of EVs and renewable energy.

When you've come this far, you look further into the future. Today, we're working towards the next 150 years. Towards a future of sustainable productivity for industries, through continuous innovation and conscious actions that consider the wellbeing of society and the planet.

**This is a future being shaped with passion
by our people, for Pune, India and the world.**

NEW SYNCHRONOUS MOTORS MAKE FOR HIGHLY EFFICIENT SUBMERSIBLE BOREHOLE PUMPS

KSB Aktiengesellschaft, Germany, will be presenting a range of pumps for water production applications. Among them will be submersible borehole pumps with new energy-saving motors up to 150 kW.

The drives are permanent magnet excited synchronous motors. Their output per size clearly exceeds that of conventional asynchronous motors. If comparing motors of the same size, synchronous machines have a markedly higher output and lower heat development. With efficiencies being much higher, enormous savings and relatively short payback periods compared with asynchronous machines can be realised. The motors are operated on a frequency inverter. The adjusted flow rates reduce the frequency of starts and, with that, the load on the winding. As this optimised operating mode also keeps the frequency of pump starts to a minimum, it decreases wear and extends the pump's service life. A mechanical seal prevents

the fluid handled from mixing with the fluid in the motor space, which increases the availability of the motor. The motor's thrust bearing is water-lubricated and has self-adjusting tilting pads. Requiring no maintenance, it easily copes with the stresses and strains of continuous operation thanks to the material combination of stainless steel and hard carbon. While the pump set is started up, the counter thrust bearing absorbs the axial thrust caused by the hydraulic system of the pump and prevents the impellers from coming into contact with the stage casings. This results in a high operating reliability and achieves the long service life customary for submersible borehole pumps. Smooth running is ensured by a dynamically balanced rotor. The pump sets are available in different material variants to match the application. For aggressive fluids, for example, pump sets of 8 inch and larger are

available in duplex stainless steel. Both, the pumps and the motors, are certified for use with drinking water. Due to their high output, the new synchronous motors can be combined with much larger pumps of between 6 and 14 inch. Flow rates of up to 850 cubic metres per hour can thus be pumped much more efficiently with the UPA type series. A patented sand separator prevents any abrasive wear in the pump. The enclosed pump bearings are maintenance-free. A lift check valve with anti-blockage valve disc increases the pump set's operating reliability. Its integrated spring prevents waterhammer thanks to minimum valve closing times. This means the operation will also be gentle on the complete well system and its individual components.

CHROMIUM IMPELLERS AT TSURUMI

Pump manufacturer Tsurumi is equipping several pump series with ultra-hard chromium impellers free of charge. Once again, Tsurumi wants to define the standard in the market. The Japanese company with its European headquarters in Düsseldorf, Germany, is manufacturer of dewatering pumps for the construction industry. Hard as a Katana sword

The impeller is the pump's propeller, so to speak. It is located on the shaft at the intake opening and "shovels" the water into the unit. Enormous forces act at this point. They are caused by the high rotational speeds and abrasive sediments in the water. Tsurumi even tolerates hard rock up to 30 mm grain size at a flow rate of up to 12 tonnes per minute in the chromium equipped pump models.

The high chromium content of up to 28 per cent makes the impellers extremely wear-

resistant. The material is five times more resistant to abrasion than grey cast iron or stainless steel, the manufacturer said. Tsurumi gives exact specifications: The hardness according to Rockwell, the internationally used unit of measurement for technical materials, is 51. For the pumps of the GY series it is even 60.

This puts the Tsurumi impellers on a par with the legendary Japanese Katana blades, a reference in terms of hardness and cut resistance.

Vortex impeller plus wear plate

Tsurumi always uses semi-vortex impellers. In combination with its wear plates, the manufacturer achieves hydraulic efficiency levels similar to that of closed impellers - without their disadvantages. Another plus: by readjusting the wear plate, the optimal pressure point of the pump can be set even when the abrasion is already far advanced. The impeller can thus run significantly longer. This reduces the costs and maintenance times of the pump.

In Europe alone, the manufacturer offers more than 500 pump types with flow rates up to 30 cbm/min and 216 m maximum head. "Stronger for longer" is the marketing slogan of the company, which was founded in 1924 and specialises exclusively in water pumps. Find out more at Tsurumi.eu on the internet.

NEW HIGH-EFFICIENCY 10-INCH STAINLESS STEEL WELL PUMPS

Everest
INDUSTRIES

We would like to introduce here with as among the leading manufacturers for below mentioned products. We take proper care in the manufacturing of any of the product so that we can give guarantee for the same. we assure your good selves for the best quality of the products along with the genuine services.

So, contact us for hassle free and long lasting equipments as under.

Products :

- Centrifugal Pump, Mud Pump, Available Material of C.I., M.S
- Size 4" x 4" , 3" x 3" , 2" x 2 1/2"
- D.R Rotary boring machine , RR boring machine
- Material Handling Equipment, All type of Gear Box.
- All type of fabrication and Precision job work.

MFG. OF:
STONE CRUSHER AND VIBRATING SCREENS
ALL TYPE OF DOUBLE ACTING MUD PUMP,
CENTRIFUGAL MUD PUMP, ROTARY DRILLING RIG

Please contact us for more details.

EVEREST INDUSTRIES

PLOT, NO. 418, ROAD, NO. 10, Phase II, KATHWADA G.I.D.C, Nr. Odhav

Octroi Naka, Kathwada, Ahmedabad GUJARAT, INDIA - 382430

Email: everestind2552@yahoo.co.in • Web: www.everestindustries.co.in

Ph. : (O) 079-22902552, M.: 09427710684, 09426171430

Authorised Distributor: A S Enterprises - Anil Shisodia Contact Number +91 93772 10438

At the beginning of 2023, the KSB Group is going to launch a new submersible borehole pump series onto the market. Named UPA S 250, this pump series will extend the manufacturer's range of well pumps. It is designed for use in general water supply, agriculture, mine dewatering and ground water management as well as for general pressure boosting tasks, for example.

Thanks to their optimised hydraulic design, pumps of this type achieve very high levels of efficiency. The wear-resistant design with metal casing wear rings and silicon carbide bearings keeps energy consumption to a minimum for many years, even in the case of high sand contents in the fluid handled. UPA S 250 will initially be available in three different hydraulic system sizes.

It covers flow rates between 60 and 400 cubic metres per hour. The maximum head is 360 metres. All cast components are made of high-grade stainless steel 1.4408 or, optionally, 1.4517.

On request, the new pumps can also be combined with the high-efficiency electric motors of the UMA-S series. These drives are synchronous motors with permanent magnets. Their output per size clearly exceeds that of conventional asynchronous motors.

If comparing motors of the same size, synchronous machines have a higher output and lower heat development. With efficiencies being much higher, the payback periods are shorter than those of asynchronous machines. The motors are operated on a frequency inverter. Demand-driven operation is ensured by flow rate adjustment, resulting in additional potential savings. Also, depending on the system type the frequency of starts and the related load on the pump winding can be reduced, which decreases wear and extends the pump's service life.

For operation without a frequency inverter, KSB trims the impeller diameters of UPA S 250 precisely to the required duty point. This is how characteristic curves are individually adjusted to the demand and excessive power consumption is prevented for fixed-speed operating modes. The pump is certified for drinking water applications to ACS (French drinking water certification) and meets the requirements of the German Environment Agency.

Stuart turner expands aquaboost ibolt range with triple pump booster set

In the latest addition to its AQUABOOST range of cold water booster sets, expert pump and water boosting solutions manufacturer, Stuart Turner, has added a triple pump variant to its established AQUABOOST iBOLT line of variable speed booster pumps and pump sets.

The NEW AQUABOOST iBOLT triple pump booster set perfectly complements Stuart Turner's existing single and twin pump ranges and can produce heads of up to 9.2 bar and flow rates of up to 45m³/hr.

- Designed to be high performing and intuitive to commission, the AQUABOOST iBOLT range offers constant water pressure supply where flow demand varies
- AQUABOOST iBOLT high head, cold water pressure and flow boosting solutions are ideal for residential and commercial applications
- The expanded AQUABOOST iBOLT range now offers flow rates of up to 45m³/hr

The entire AQUABOOST iBOLT range features Regulation 4 WRAS-approved, 304 stainless steel horizontal multistage pumps controlled by air-cooled variable speed frequency inverters mounted directly on the pump motor. This use of state-of-the-art technology improves energy efficiency and reduces running costs when compared to fixed-speed systems.

All AQUABOOST iBOLT pump and booster sets feature Regulation 4 WRAS-approved lever ball valves and BMS volt-free contacts, while the new triple pump booster set incorporates a Regulation 4 WRAS-approved 24-litre pressure vessel, providing an added buffer of pressurised cold water to supplement pressure and flow.

With most models in the AQUABOOST iBOLT range available ex-stock and short lead times on non-stock variants, the excellent availability of the pumps and booster sets minimises project delays.

Thanks to Stuart Turner's innovative use of QR code technology, which has seen the company reduce paper usage by 11 tonnes in two years by eliminating paper manuals from two product ranges, the AQUABOOST iBOLT range is intuitive and easy to commission. Installers simply need to scan a QR code on their mobile phone and it directs them to the O&M Manual for the relevant product information.

5-MSP Submersible Utility Pump – Franklin Electric Co.

Franklin Electric Co. Inc. launched the next generation of Little Giant® 5-MSP compact submersible utility pump. The new pump offers the same compact size yet features a new motor designed to boost the pump's overall performance and efficiency.

The 5-MSP, originally launched in 1980, is widely recognized among landscape professionals, homeowners, and hobbyists, who trust it for general water circulation in ponds, fountains, water displays and hydroponics. Among the most compactly sized and highest pumping capacities of any submersible pump on the market, it delivers proven power along with dependable operation.

Now, Little Giant is improving these iconic features with the next generation of the 5-MSP.

"Our goal was to offer the same little stature that Little Giant is known for but create a bigger impact in terms of performance and value," says Jeff Wilder, North American plumbing product manager, Little Giant. "The new 5-MSP is nearly identical in core features and aesthetics to the original, but at the heart of it is much more powerful and built for the future."

This new "heart" is a permanent split capacitor (PSC) motor that operates without oil—creating a more environmentally stable unit that is better suited for outdoor living applications. It also runs more efficiently, delivering the same or better pumping capacity than the original 5-MSP, but at greater depths, and offers continuous-duty rated for reliable 24/7 operation.

Core features such as the stainless-steel motor shaft and an epoxy powder coated aluminum body, mirror those found in the original 5-MSP. Also much like the original, the next generation of the 5-MSP is still the pump of choice to be used for any commercial, industrial, and home applications where water must be transferred or recirculated. For more information, visit www.littlegiant.com.

ELGi Rig Compressors
with Superior Technology that delivers

BETTER PERFORMANCE

BETTER RELIABILITY

BETTER PROFITS

ELGi®

Always Better.

PG 575S-225

PG 1250

With customers trying to save time and increase productivity, inconsistent and extreme operating conditions make drilling a very demanding industry.

ELGi Rig Compressors are built to meet these demands and function in challenging situations and exceed all expectations by delivering superior performance, reliability and profits.

ELGi's Rig Compressors offer faster penetration, low fuel consumption, an exceptionally durable engine, and a compact and robust package.

Dear Customers

Thank you!

for your presence at the grand opening of our new branch office in Tiruchengode. It was an absolute pleasure to have you with us as we unveiled our latest facility and showcased our rig compressors. Your presence and support made the event truly special.

Thanks again for being integral to our journey and making the new branch office opening successful!

Tiruchengode Branch Office:

No. 106/8-6, Swamy Complex,
Sankagiri Main Road, Seetharampalayam Post,

Watertight cable connections at the pump casing

mechanically support the cables' own weight and at the same time protect them against flow turbulence. For this purpose KSB has developed a patented cable holder. The cables are attached to a support rope with rubber profiles. The support rope is then fastened to the discharge tube cover with a turnbuckle and shackle. In the case of an open discharge tube, it is fastened to a cross-beam. This ensures that the cables have a long service life and the cable entry into the motor housing is absolutely tight. Double mechanical seal for protecting the motor against dirty water The shaft is sealed by a double mechanical seal. Mechanical seals are indispensable for sealing rotating shafts. They make sure that the fluid handled remains in the system, prevent emissions and thus protect the environment from contamination. High-quality shaft seals in the form of mechanical seals also ensure maximum economic efficiency and

operating reliability for pumps. This is crucial because the majority of repairs arise due to sealing problems. Submersible motor pumps are fitted with mechanical seals in tandem arrangement with a liquid reservoir and high-quality, wear-resistant contact face materials for many years of trouble-free operation. Monitoring by float switch and sensors The mechanical seal is monitored by a float switch. Various sensors emit a warning at an early stage, before damage may occur. They monitor vibrations, moisture in the motor and connection space, and the temperature of motor winding, coolant and bearing.

The benefits of submersible motor pumps are clear to see: They are much more compact than conventional tubular casing pumps of the same hydraulic performance. No extra buildings or housings are required for the motors, and they are easier to handle regarding maintenance and installation. Only: How safe is it to operate these pumps continuously submerged in and surrounded by very dirty water? Is there a risk of fluid entering the pump, causing short circuits or damage to the motor? Generally speaking, this risk affects all pumps with a submersible motor but only in the event of a defect, such as a missing test port screw, a fractured pump body, old and brittle sealing elements or a faulty casing. Other examples are damaged or incorrectly seated O-rings, grooved shafts or improperly lubricated or even incorrectly seated shaft seal rings. In these cases, too, water can enter the motor space. Bearing in mind that submersible pumps that are permanently installed in waste water tanks are out of sight when performing important tasks such as protecting basement rooms from backflow, maintenance is key. Maintenance can prevent all of the above. If the pump is not mechanically damaged, no water can enter the pump. The pump is monitored by various sensors. In the event of any damage leading to water entering the pump, the pump will be stopped via the monitoring sensors. Watertight connection: How to prevent water from entering via the cables All of KSB's submersible motor pumps (for instance the Amarex KRT and Amacan type series) are fitted with an absolutely watertight cable entry. Even if the cable insulation is damaged during installation or operation, this patented system protects the pump against ingress of the fluid handled into the motor space and into the terminal box. The insulation of the individual cable cores is stripped and the wire ends are tinned. This section is fixed in the cable gland system with spacers and then completely embedded in synthetic resin. A rubber gland provides additional sealing. This sealing concept is used for both the power cable and the control cable. Naturally, all of KSB's submersible motor pumps meet the requirements of enclosure IP68 (International Protection). The first digit, the 6, stands for "dust tight" and the second digit, the 8, signifies "suitable for continuous immersion". When the pump is installed in the discharge tube, it is necessary to

Supreme
People who know plastics best

Total Piping Solution

Complete Piping Solutions for Borewell Applications

The Supreme Industries Ltd. is an acknowledged leader of India's plastic industry. It is credited with pioneering several path breaking products and has gained a valuable experience in providing innovative and cost effective piping solutions. The Company has been a trend setter and a torch bearer in the transition from conventional to advanced plastic piping products in the country. The Company's objective is to meet the growing needs of its clientele in water and waste management and in infrastructure sector through a specially designed high performance range of piping products. The innovative product portfolio offered by Supreme is extensive in nature and applications. With its range of over 7500 products, the most comprehensive in the piping industry, Supreme caters to almost every conceivable need and application in piping.

Jeevan bhar ka saath...

SAER launches new wastewater division

In this historical period where scarcity of raw materials and supply difficulties are an everyday issue, SAER has decisively responded with a made-in-Italy product range, with extremely competitive delivery times. Indeed, in the water treatment sector fast delivery is vital, but so is providing customised solutions to satisfy clients' needs.

In order to meet the needs of clients in search for alternatives in the wastewater market, over the last few years SAER has been investing in the research and development of its newest ranges for wastewater: the SD range of submersible sewage pumps, and the NCA range of end suction wastewater pumps.

SAER – a specialist in the clear water sector for over 70 years – channelled its experience to conceive highly efficient products, without giving up on robustness and durability.

SD range
Let's look in detail at the characteristics of the SD series, whose range goes from 2m³/h up to 2000m³/h with head from seven to 54m, and is characterised by its "armoured" build, granting an incredible impact and corrosion resistance.

Waterproof
Coming from SAER's unmatched knowledge in borehole pumps and submersible motors, the cable output is waterproof, tested against water penetration up to 20 bar.

Easy maintenance and high safety standard, with a single cable that includes power and signal conductors.

Smart
Watertight and wide connection chamber.

Organised and simple terminal block studied for easy maintenance.

Wear resistant
Wear disc between impeller and pump body provided with cutting channel. Two-component epoxy paint with corrosion resistance according to EN 12944-6 grade C3-M.

Reliable
AISI 431 stainless steel shaft or with Duplex shaft end.

Optimum torque transmission, reduced material stresses and easier maintenance thanks to a shaft and impeller hub with polygon profile. Long life bearings for a life of approx. 100,000 hours in continuous (MTBF).

Energy savings
SAER premium efficiency motors are IE3 from 0,75kW up to 132kW, 2, 4 or 6 poles.

Hydraulics designed and engineered with CFD systems (Computational Fluid Dynamics) to combine efficiency, performance and free passage.

Safe
Exclusive double mechanical seal in oil chamber protection for troublefree operation. Process side seal in Silicon Carbide/Silicon Carbide (on request Tungsten Carbide or other materials). Protection probes for humidity, temperature and overheating.

Versatile
Several types of impellers available: vortex, open, closed or propeller.

NCA range

In order to address the needs of surface wastewater pumping, the NCA range is the ideal answer. The range is continuously evolving and in the short-medium term is going to cover the following range:

Flow=20-2200m³/h

Head=5-65m

Absorbed power=4-200kW

Outlets from DN65 till DN300

As one of SAER signature traits, the hydraulics is typically robust with centreline discharge to equalise foundation loadings and rigid feet for reduced vibration.

The robust bearing design is capable of withstanding maximum axial loads for long periods and the high strength stainless steel shaft provides continuous service. The efficiency of the machines is high, combining energy savings with a wide free passage.

A special volute design reduces radial loads. Thanks to the back pull-out design configuration, maintenance is simple and there is replaceable wear plate on the suction side.

The pumps can be provided in different materials, the impeller can be either closed or open, and the seals can vary between soft packing, component mechanical seal, single or double cartridge seal with different flushing plans.

There are two types of bearings bracket for standard and heavy duty applications, with the choice of different lubrication systems. Upon request, it is possible to get the pump with windows for inspection.

Commercial Hydraulics

Parker Commercial Hydraulics are the world's leading supplier of OEM hydraulic components, giving your plant & equipment the hydraulic power to keep running day in, day out, week after week, year after year.

DRILLMAX

Gaining Ground on Geothermal Energy Expansion

Businesses and homeowners are increasingly honing in on the benefits geothermal energy systems offer beyond being a green, reliable energy source. Often, savings on monthly utility bills pay for financing a system. Many see a return on their investment in a geothermal retrofit. In recent years, the federal government — and even some states — implemented tax credits and incentives for the renewable energy option. The developing demand for geothermal energy systems has generated growth in the drilling industry. Some drillers have been enticed to explore expanding into geothermal drilling. For existing geothermal drillers business is booming, while others weather fluctuations by diversifying their service lines with a single rig. Taking Geothermal Well Drilling Business to Next Level Launching Island Geo Drillers in New York seven years ago, Joe Dalba and partner Ryan Maletta were ready to take their closed-loop geothermal installation

business to the next level. Their projects were progressing from residences with up to 50-ton fields to schools requiring 300-ton fields with 90 bores to 350 feet. Yet, they desired to go after more municipal projects. What they needed to take the next step was a new drill rig. “We wanted to increase efficiency,” Dalba said. “We wanted to go deeper and needed more power and pullback, switching from 10-foot to 20-foot stroke to clear holes of cuttings.” They looked at several different rigs, wanting to keep everything non-CDL. “To get a more capable rig and take our business to the next step, the DRILLMAX® DM250 was the only one non-CDL,” Dalba said. “Others with these capabilities required a CDL or were not yet in production, just prototypes.” Dalba did his research, talking to other DRILLMAX® owners on the island. “I watched videos and thought, ‘It can’t be that fast.’ It almost startles you,” Dalba said. “With our old rig, I’d look at the pressure gauge because I had time to, but

this just happens in the blink of your eyes.”

On one job, COVID-19 restrictions limited them to just the two owners on site. Dalba and Maletta completed the 15 bores to 305 feet through tough, plastic clay in 80 percent of the hole. Dalba ran the rig. Maletta worked the mud cleaner, getting loops ready for installation.

“The DM250 took a beating but got right through it. We doubled our production speed with the stroke and pump,” Dalba said. “The way the rig forces plastic clay out of the hole was pretty unbelievable. The 20-foot stroke and speed of the tophead mean it goes faster for a longer distance, good for plunging clay out of the hole.”

The pressure consistency produced by the piston pump, physical comfort created by the wide driller’s platform, and production capability provided by the rod loader add to the advantages afforded by the DM250.

“It has everything really. It’s faster and lots easier,” Dalba said. “Speed of tophead rotation combined with 20-foot stroke on tight package, ramps up production, and it being non-CDL also saves on insurance.”

Going at “Geo-Pace” Going after big mud rotary work, PanTerra Energy is often hired after someone has been unsuccessful. But their powerful equipment isn’t the only source of the Colorado-based company’s success.

“Our success is due to our equipment, diversification of services, and ability to train and produce quality people,” Skyler Wilson, operations manager, said. PanTerra’s ability to easily — at interstate speeds — mobilize their fleet of smaller, lightweight rigs also contributes to increased demand for their services, which prompted purchase of a new DM450.

“Even with COVID-19, the majority of the drilling market has been really, really busy,” owner Mike Ryan said. “We’d have never survived if we just did geothermal once the tax credit went away. But in the last 14-15 months there’s been an uptick in the school and university market, and we continue to grow our other service lines.”

When comparing their 2020 DM450 to their 2015 model, improvements include rollers on the carriage and sleekly laid out hydraulic lines, while the manual hydraulic controls provide the power and precision Wilson has come to expect from DRILLMAX® rigs.

“The rigid drill mast design drills straighter holes,” Wilson said. “The redesigned rod spinner increases efficiency tripping out of the hole.”

SPEED FOR GEOTHERMAL ENERGY

The speed and ability of the single rod loader to keep adding pipe make the DM450 well suited for geothermal jobs.

“On average, the DM450 is 1.5 times faster than our other rig,” Wilson said. “Just the tophead movement on the other rig takes twice as much time as swinging the rod handler. Once you’re out of rod in the other rig carousel, adding pipe takes 10 times as long.”

The driller was impressed the DM450 kept up with the “geo-pace of drilling four to five holes a day.” He boasts the DM450 accomplished more than the combined footage of three other rigs on a geothermal job in the Rockies.

POWER FOR CATHODIC PROTECTION

Completing 8- to 12-inch diameter holes, 300 to 1,000-feet deep is standard for cathodic protection. PanTerra has done 10-inch to 320 feet, drilling the hole in one day and coming back to clear the hole the second — keeping production right on schedule. Wilson credits the 5.5 X 8 mud

pump for their success.

“We have the pressure to lift heavy cuttings out of the hole. It’s close to putting out the volume of a 4 X 3, but with 200-250 psi pressure to clear the hole,” Wilson said. “We’re able to muscle in the hole to depth and clean up afterwards.”

The demand for cathodic protection services takes PanTerra to 15 different states in order to meet the needs of their customers.

“We’re not a big company, but have a significant footprint,” Ryan said. “We’re a people-first, equipment-second company.”

SERVICE SUPPORT

Having a central U.S. service center nearby provides peace of mind. A recent stop in Kansas added valuable training for their driller.

“The engineers exchanged knowledge with the driller as to why the rig was designed a certain way. The driller shared our field challenges,” Wilson said. “This will probably help someone down the road.”

The driller was impressed with the engineering team.

“There were a lot of smart ideas being discussed. The DRILLMAX® engineers offered solutions done right, not just Band-Aids,” he said.

For Ryan, having engineers receptive to driller feedback for product improvement distinguishes DRILLMAX® from other manufacturers.

“It’s not always the case that engineers have an open mind to suggestions from drillers,” he said. “DRILLMAX® engineers seem to really be interested in feedback from the field. When it comes down to it, it’s about people. The DRILLMAX® commitment to make things right is important.”

KSB launches pneumatic quarter-turn actuators

The double- and single-acting pneumatic Actair Evo and Dynactair Evo actuators are designed for actuating all types of part-turn valves, such as butterfly valves, ball valves and plug valves. Applications include water treatment, wastewater treatment, power generation, general industry, refinery engineering and shipbuilding. The double-piston KSB actuators can be operated with compressed air to ISO 8573-1 from 3 to 8 bar. The maximum torque is 8000 Nm for the double-acting type series and 4000 Nm for the single-acting variant. The maximum ambient temperatures should be between -50°C and +150°C. With their IP68 enclosure, the actuators are suitable for use in a maritime environment.

This means that – in the event of flooding – they will remain water-tight for about 169 hours at a depth of up to 30 metres. The pneumatic connections comply with NAMUR requirements. As standard, the actuator is fitted with a position indicator and adjustable mechanical stops. The actuators are lubricated with silicone-free grease at the factory, their gear housings are made of anodised aluminium alloy. With their standardised interfaces, the actuators can be connected to higher-level process control systems with solenoid valves, positioners and diverse digital and analogue control units.

LASER CLADDING

For Down The Hole Rock Drilling Tools, a fully automated additive process, improving wear and corrosion resistance of products.

Laser cladding as process for hard facing of rock drilling tools offers many advantages over manual welding processes. In the event of higher heat input, the high density WC particles sink to the bottom of the weld pool, and due to lower heat input there can be bonding issues with the base material. In manual processes, a consistent and uniform heat input cannot be guaranteed at all times, and also varies from welder to welder, see picture above. high wear resistant Ni-base matrix in comparison to a Fe-base matrix used in other processes. Laser cladding is an automated process, where a consistent and uniform process can be ensured. This enables for a uniform distribution of Tungsten Carbide particles over the complete weld thickness, consequently longer life of the drilling tools. Laser cladding also allows for a high wear resistant Ni-base matrix in comparison to a Fe-base matrix used in other processes.

How different it is from the regular process – See the following pictures taken in our Lab.

This process has the following advantages:

1. Higher wear resistance
2. Uniform distribution of Tungsten Carbides
3. Localized heat input through Laser preserves microstructures of heat treated steel

4. Uniform hardness along the depth
5. Scalability and Productivity with consistent quality

Gates DRIVEN BY POSSIBILITY™

MINE MASTER™ RIG HOSE 1000HT

CHAMPION FOR DRILLING RIGS

Gates innovative solutions can be found on virtually every part of a drilling rig, and the equipment that supports operations. From top drives to mud pumps, and everything in-between, our team of industry experts and product engineers design, test and manufacture Gates solutions that are trusted to power your most complex pumping and hydraulic equipment under the most demanding conditions.

- LONG LIFE OIL RESISTANT TUBE
- 2 WIRE PERFORMING HOSE
- ABRASION RESISTANCE ROBUST COVER

Recommended For: Pneumatic service in heavy duty drill rig compressor upto 1100 CFM capacity in ground drilling, quarries, construction and general industry.
Working Pressure: 1000psi
Temperature Range: -40 °C to +135 °C

Mfg of : DTH Hammers, Button Bits Mining Tools & Drilling Equipments

Whizzkid has been one of the most prominent manufacturers of DTH Hammers and Button Bits to have emerged and been in operation from this part of this world for over 36 years. By supplying these products in premium quality, we have also created a mark in the export industry. The excellence assured in terms of Quality as also carved out a strong International clientele, who have been using our products in various countries.

WHIZZKID
India's most trusted DTH Hammers & Bits

Balaji Engineering
AN ISO 9001:2015 COMPANY

**DTH Hammers:**

- Higher end consistent penetration rate
- Avoidance of back hammering
- Hammer blocking
- Durability
- Corrosion and chemical resistance
- Withstanding capability at the range of higher pressure

DTH Button Bits:

- We bring forth premium Button Bits for our esteemed customers keeping in mind their demands.
- These Products are manufactured using high grade materials and ensure first class range.

Product Range :

- DTH Hammers (3-12 inches)
- DTH Button Bits (3-18 inches)
- DTH Over Burden Bits (4-14 inches)
- Drifter Bits
- Retract Bits
- Cluster Hammers
- Rock Roller Bits/Tricone Bits

When Rotary Bits Hit Rock Bottom, It's Hammer Time

You'll need to pack the most powerful tools when drilling boreholes for water wells in regions with the hardest rock formations. Mud rotary and tricone bits easily drill through soft to medium soil formations, but you'll want to switch to a down-the-hole hammer for maximum productivity in the toughest rock formations, such as quartzite, granite or basalt. This switch will also save you time and money by eliminating premature wear of the drill bits. The DTH hammer excels at boring through rocky soil and solid rock because of its percussive operation. Inside the DTH hammer, an air-powered hammer transfers energy through carbide teeth to shatter the rock surface, while the compressed air blows away the small rock fragments. It's sort of like a compact, spinning jackhammer that can fit

inside a borehole. And, when paired with Lone Star's portable drills, you'll reach 400-foot, or 122-meter, depths.

Lone Star offers 3-, 4-, 5- and 6-inch diameters hammers, which are all compatible with the full line of Lone Star hydraulic drills. As an added bonus, air compressors offering 185-cfm output can power the 3-inch hammer and are generally easy to find on the used equipment market or through rental dealers. To achieve the fastest drilling speeds for the 5-inch and 6-inch hammers, select an air compressor that generates up to 400 cfm.

Here are a couple tips if you're not sure which size hammer is best suited for the project:

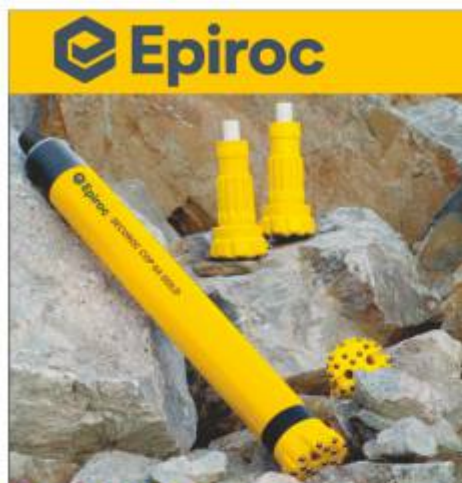

- Choose the 3-inch or 4-inch model with a 4-inch ID casing set for drilling 3-3/4-inch or 3-7/8-inch boreholes in underlying rock.

Pair it with trailer-mounted models LS300T+, LST1A+ or stand-alone rigs such as the LS200H or LS200H+.

- Consider the 5-inch or 6-inch hammer with a 3-1/2-inch drill pipe for sinking a 6- to 7-inch borehole through mixed layers of rock and sand, clay, or gravel. Pair it with the LS400T+ to quickly reach the aquifer.

Proper anchoring of the drill also plays a large role in using the DTH hammer. For heavy, trailer-mounted rigs, anchoring isn't always necessary. But for compact, lightweight drilling equipment, such as our LS200H, LS200H+, LS300H and LS300H+, anchoring stabilizes the drilling platform and helps force drill bits and DTH hammers through soil and rock. Our LS200H and LS300H series drills require 30-inch-long anchors for drilling into clay, loamy and sandy soils. If the drill site is on rocky terrain, drillers must find alternative methods for anchoring the drills, such as placing water-filled tanks or barrels packed with rocks onto the unit. This anchoring force is crucial to pushing the DTH hammer, as well as heavy-duty drill bits, through rocky material.

Finally, picking the best drill for the water well or geothermal project is no easy task and matching it closely to the soil conditions can impact efficiency. We're ready to help you choose the ideal rig for your next project, whether you're drilling water wells or completing soil sampling.

DOWN THE HOLE RIG MACHINE

Kiran Engineers an ISO 9001:2008 Company, is the outcome of meticulous planning and deep industry knowledge. We are acclaimed as a distinguished manufacturer, Exporters and supplier of all kinds of Water Drilling Rigs, Mining Rigs and Equipment in global market which are widely used for water wells, core drilling and multipurpose drilling. These equipments are appreciated for their excellent functionality, high speed operations, handling capacity, sturdy construction and energy saving features.

Our wide range of high performance drilling equipment's include D.T.H. Drilling Rigs, Truck Mounted Drilling Rigs, Tractor Mounted Drilling Rigs, Trolley & Trailer Mounted Drilling Rigs, Crawler Drilling Rigs, Wagon Drilling Rigs, Slim Drilling Rigs, Inwell Type Lightweight Rigs, etc.

Engineering Industry requires precision, accuracy and perfection as all the activity in this fields are performed on pre calculated formulas.

Kiran Engineers can produce any tailor made & customized solution for global market.

Kiran Engineers has established their brand image by providing best quality products which are as par with international standards & cost effectiveness with higher efficiency products.

Sandvik DR413i bolsters intelligent rotary blasthole range

Sandvik Mining and Rock Solutions is introducing Sandvik DR413i, the fourth drill rig in its intelligent rotary blasthole range. Purpose-built for high-altitude hard rock mines, Sandvik DR413i represents the natural evolution of Sandvik D90, known across the globe for its consistency and durability. Ideal for iron ore and copper applications at altitudes up to approximately 15,000 feet (4,500 meters), Sandvik DR413i can drill a hole diameter range of 9 7/8 to 13 3/4 inches (250 to 349 millimeters). Its power pack is designed specifically to support high-altitude drilling, enabling impressive performance without an oversized rig. Sandvik DR413i bridges a gap between Sandvik DR412i (8 to 12 1/4 inches, 203 to 311 millimeters) and Sandvik DR416i (10 5/8 to 16 inches, 270 to 406 millimeters). Customer feedback from those two models played a crucial role in development of Sandvik DR413i, the first unit of which has already been sold to a U.S. iron ore mine. "Sandvik DR413i is powerful, productive and precise, and continues our long tradition of developing innovative technology to help drill-and-blast customers improve productivity and

reduce cost," said Dave Shellhammer, President of the Rotary Drilling Division at Sandvik Mining and Rock Solutions. "As demand for our intelligent rotary blasthole drills grows, this expansion of our range underpins our customer-centric approach." Sandvik DR413i delivers a single-pass capacity of 55.7 feet (17 meters) and 115,000-pound (52,160-kilogram) weight on bit. A traveling centralizer reduces pipe flex, producing cleaner, straighter holes. The rig is equipped with Performance iDrill and Navigation iDrill onboard automation solutions to increase accuracy and productivity. Sandvik DR413i is the company's latest scalable automation solution: AutoMine® can extend onboard features to enable line-of-sight, control room or fully autonomous operation. Key Sandvik DR413i features work collectively to increase productivity. The Sandvik Intelligent Control System Architecture (SICA) provides the operator with real-time feedback regarding the machine's performance and health, eliminating guesswork. SICA and onboard automated features such as Auto Drill and Auto Cycle ensure hole-to-hole

quality and consistency. Sandvik DR413i reduces personnel-to-machine contact while maximizing component life. Its maintenance-friendly design reduces the time needed for scheduled and unscheduled tasks, improving safety and ROI. The new rig also supports customers' sustainability needs. Intelligent system load management helps reduce carbon emissions and extend component life, improving operating costs. The compressor control system matches compressor volume to application, reducing fuel burn and resulting environmental impact while improving hole quality. Mincon Launches New DTH Hammer Line-Up For 2023

Mincon Group plc has unveiled its next-generation DTH hammer range that will be available starting in 2023. The product range is centred around high-efficiency DTH hammers that combine class-leading penetration rates with proven energy savings that will help customers reduce their drilling costs and carbon emissions. Mincon's MP-series is the company's next generation of DTH hammers. It starts with the MP30, a 3-inch-class hammer that can be equipped with drill bits between 85 mm (3.4") and 105 mm (4.2"), and tops out with the MP400, a 40-inch-class hammer for large-diameter drill bits between 1000 mm (39.4") and 1524 mm (60").

The complete range:

- 3-inch-class hammers: MP30, MP35, MP36
- 4-inch-class hammers: MP40, MP4H
- 5-inch class hammers: MP50, MP56
- 6- and 7-inch class hammers: MP60, MP65, MP6H, MP70
- 8- and 9-inch class hammers: MP80, MP8H, MP90
- 10- and 12-inch class hammers: MP100, MP120

Large-diameter hammers (15 to 40-inch): MP150, MP180, MP240, MP340, MP400

Shanks for all applications

When it comes to support for drill bits, Mincon's MP-series of DTH hammers offers unparalleled versatility and compatibility. Each hammer model supports the industry-standard shanks for its size class. Additionally, Mincon offers hammer variants that support drill bits without a footvalve (also known as tubeless drill bits). Drillers may prefer to use drill bits that have no footvalve

depending on ground conditions and also for reliability reasons.

New arrivals

Included in this comprehensive range are two all-new models to bolster the large-diameter range: the MP150 and MP400; both of which have been designed to deliver efficient performance for piling and foundation drilling.

Efficient performance

Since launching its first DTH hammer design in the 1980s, Mincon's ethos of continuous improvement has seen its product range evolve and grow. Mincon's technical experts work closely with drillers to get feedback from work sites, which the engineering, manufacturing, and customer support teams use for the ongoing development of new models. Mincon manufactures all models in the MP-series of DTH hammers at its state-of-the-art facilities in Ireland and Finland. With ownership of the manufacturing and heat-treatment processes, Mincon is able to ensure that each DTH hammer is built to deliver the most reliable and efficient performance.

The 2023 DTH hammer range offers a comprehensive selection of models for all ground conditions and applications. When used with other products in Mincon's range, including DTH drill bits, drill pipe, and associated accessories, customers will benefit from next-generation drilling technologies that improve penetration rates without compromising on efficiency, while reducing emissions and drilling costs.

Joe Purcell, CEO, Mincon Group, said:

"I'm immensely proud of the work our engineers and product teams have done to bring a comprehensive DTH hammer range to market. Thanks to decades of fine-tuning our manufacturing processes and product designs, these next-generation hammers will offer customers real-world cost savings and higher productivity."

DOOSAN® Portable Power

Doosan Portable Power has been serving the large water well drilling industry from more than 2 decades now.

The Doosan large range of portable compressors cover 700cfm to 1400cfm in flow with 250psi to 365psi working pressures. Known for their reliability and unique Automatic Temperature Control (ATC)* these compressors provide excellent drilling performance, fuel economy, compact design for plug and play mounting.

In its quest for continuous product improvement to meet customer expectations and providing cutting edge solutions to this industry segment, Doosan Portable Power offers certain models with electronic engines and dual pressure regulation. These compressors can also be deployed for deep piling work in infrastructure segment.

DRILLMAX[®]

Efficient Rig, Solid Support for Well Installation

Running one legacy model DM450, family-owned DICK JOYCE WELL DRILLING found themselves looking for a solution to their lengthening list of well installation work.

"We got into the market for another rig due to our extensive backlog," Ryan Hadden, operator, said. "We found ourselves months out for new well installs and began losing work due to the length of time our customers were forced to wait."

Hadden began in 2010 doing service, water filtrations, and a variety of things for the Florida company his grandfather started in 1969. He progressed to driller's helper a few years ago. When the company — owned by his mother and uncle since 2002 — purchased the new DM450 it became his first machine as driller.

"We can now service our customers quicker and keep up with growing demand," Hadden said. "There's a lot to be impressed by with the rig — power being one of them. Since we had a legacy DM450 for several years already, we had an idea of what to expect. However the performance I've gotten out of our casing driver with the new DM450 has been outstanding."

The rod carousel on the new DM450 has not only propelled production rates but also solved their problem of accessing small job sites.

"The top head travel is smooth and quick. Paired with the 15 rod carousel, we can trip in and out of the hole very quickly," Hadden said. "We can load all the materials on one truck by utilizing the rod box as casing storage and have enough deck space for a water tank for water injection. Therefore we no longer worry about a support vehicle being near."

The ability of the air on the new DM450 to drive pipe without slowing

down means they're able to speed well installation production and expand into new areas averaging 200- to 250-feet of casing.

"We drive our casing in and typically would need to drill ahead to set that much casing to rock. With the power of this machine, many times we are able to drive all of our casing," Hadden said. "We are doing multiple wells in a day; we're also taking work in more challenging areas; and we're rewarded with still being able to finish those wells within a day's time."

They also opted for a hydraulic welder on the rig, saving on fuel and hassle.

"Having the hydraulic welder and retractable reels has saved not only space and gas but also made setting up and tearing down quicker," Hadden said.

The efficiency of the carrier also contributes to fuel savings.

"I've drilled three wells and returned to the office on one 70-gallon tank of fuel," Hadden said.

For Hadden, the new DM450 is hands-down a reliable rig, worth every bit of money paid, and "comes from good people too."

"Everyone involved is focused on keeping you up and running. Whether you need a part or a technical question answered, you will receive support as fast as possible," Hadden said. "When spending that amount of money, you're buying a piece of equipment but also the people who stand behind it. With DRILLMAX[®] you're definitely getting your money's worth in both aspects."

**AHLSTAR A PUMPS
ARE NOW AVAILABLE
WITH A CLOSED
IMPELLER**

Sulzer introduces a closed impeller to the AHLSTAR A single-stage pump range. The novelty offers enhanced performance and improved efficiency. AHLSTAR is a comprehensive series of end-suction single-stage centrifugal pumps designed to work with all types of liquids in demanding industrial applications.

The versatile A range builds on the well-established AHLSTAR's legacy and is now completed with yet another impeller option.

AHLSTAR A process pumps are available with six different impellers, each designed for specific industrial applications. Closed impellers are commonly used in water processes due to their high efficiency and good runnability. Also, a closed impeller offers a reliable option when processing flammable or toxic liquids, for instance in the chemical process industry.

The closed impeller is an addition to AHLSTAR A end-suction single-stage pumps and can use the same mechanical seals and bearing units as other pumps in the series. Due to the modular construction, the need for spare parts is minimized. The pumps are available in various sizes and materials, the most common ones being ductile iron, duplex stainless steel, and super duplex.

KBL INTRODUCES NEO SERIES 4-INCH BOREWELL SUBMERSIBLE PUMPS

Kirloskar Brothers Limited has launched a new series of time-tested Borewell Submersible Pumps—NEO Series 4-inch. This new series of Borewell Submersible Pumps are versatile. They have been designed to effectively cater to the requirements of rural, domestic and community water supply markets, including farming, buildings and construction sectors. The highly efficient NEO Series 4-inch Borewell Submersible Pumps are innovative in design with Sand Fighter arrangement, advanced water-cooled motor making it highly-efficient (30% higher discharge and 60% more life) and energy-saving (60% savings on electricity bills). The new range of Borewell

Submersible Pumps offer better corrosion resistance and have a longer product life while offering trouble-free performance due to better pump and motor alignment. These Borewell Submersible Pumps can suitably work in adverse conditions due to extra overloading capacity. Its compact, easy-to-repair design features include Carbon plus Stainless-Steel Thrust plate, and the FG200 Graded casting with Cathodic Electro Deposition (CED) coating makes it corrosion-resistant. The 99.9 % pure Copper winding adds to the longer and trouble-free life of the pump. Its comparative higher stack length makes it retain original performances for a longer period. Besides, the higher engagement area reduces the chances of loose coupling. This new series of Borewell Submersible Pumps are quite robust with international NEMA couplings; besides, the high torque motor offers wide voltage operability in the range of 180 to 240 volts which ensures protection to the motor from burning due to high or low voltage. A novelty is the dynamically balanced rotating part that ensures lesser vibrations. NEO Series 4-inch Borewell Submersible Pumps are available in a wide range of 40 models, with and without panels. KBL has a dedicated manufacturing plant for Borewell Submersible Pumps at Sanand, which ensures that all the pumps are tested rigorously on the Performance and Quality control parameters. It offers an assured nationwide after-sales service facility through its 600+ authorised service centres (ASCs) and takes pride in being a "Make in India" company that has evolved through experience and innovation.
